Lectures: Thursday and Friday 9 to 10 AM

Tutorials: (per your registration) Start in Week 2

Lecture Materials: Lecture slides available on LMS, lectures recorded on Lecture Capture

Feedback

- During/after lecture
- Tutorials
- Discussion board
- E-Mail (Hasti, Lea or Lida)
- Consultation sessions
- Assignment feedback
- Lea/Lida office (by appointment)

Subjects:

- COMP20003 (433-253/298) Algorithms and Data Structures
- COMP90038 (433-521) Algorithms and Complexity

Skills:

- Data structures & algorithms coding in C, C++, Python, Java or similar.
- Assignments to be completed in any programming language. (Elementary C and scripts to be used in lectures.)
- Familiarity with formal mathematical notation.
- Basic understanding of statistics and information theory helpful but not essential.

This subject does not include programming language tuition.

What Level of Maths are we Talking about

$$\ln \left(\frac{P(y = \text{true}|x)}{1 - P(y = \text{true}|x)} \right) = w \cdot f$$

$$\frac{P(y = \text{true}|x)}{1 - P(y = \text{true}|x)} = e^{w \cdot f}$$

$$P(y = \text{true}|x) = e^{w \cdot f} - e^{w \cdot f} P(y = \text{true}|x)$$

$$P(y = \text{true}|x) + e^{w \cdot f} P(y = \text{true}|x) = e^{w \cdot f}$$

$$P(y = \text{true}|x) = h(x) = \frac{e^{w \cdot f}}{1 + e^{w \cdot f}} = \frac{1}{1 + e^{-w \cdot f}}$$

$$P(y = \text{false}|x) = \frac{1}{1 + e^{w \cdot f}} = \frac{e^{-w \cdot f}}{1 + e^{-w \cdot f}}$$

Assessment:

- 50% final exam,
- 10% mid-semester test
- 40% project

Hurdle Requirements:

- § 30/60 exam hurdle (final and mid-semester test)
- § 20/40 project hurdle, and 50/100 overall

Projects:

- Project 1 will be released in week 3 and due in week 7.
 - Project 2 will be released in week 8 and due in week 11.
(Dates to be confirmed in project specification on subject LMS site)
- You are expected to complete these *individually*.

(Note that the non-teaching week is between weeks 9 and 10.)

Plagiarism:

Copying of one's own or another's work without proper acknowledgment

- Academic misconduct can result in penalties such as receiving zero for the assignment or zero for the whole subject
- You can refer to University Policy and Procedures for Academic Misconduct (the link is also available on LMS) to learn more about the issue

<https://academicintegrity.unimelb.edu.au/>

Report writing skills:

Improve your report writing skills.

https://services.unimelb.edu.au/academicskills/all_resources/writing-resources

Databases

Computing with data

Data vs Information

Knowledge
technologies

“Much of the world’s knowledge is stored in the form of unstructured data (e.g., text) or implicitly in structured data (e.g., databases).

“In this subject students will learn algorithms and data structures for extracting, retrieving and storing explicit knowledge from various data sources, with a focus on the web.

“Topics include: data encoding and markup, web crawling, clustering, regular expressions, pattern mining, Bayesian learning, instance-based learning, document indexing, database storage and indexing, and text retrieval.”

Learning objectives

On successful completion of the subject, students should be able:

- “To apply knowledge and skills in many fields that need extensive data analysis.”
- “To describe and apply the fundamentals of knowledge systems, including data acquisition and aggregation knowledge extraction, text retrieval, machine learning and data mining”

What the subject covers

Databases

Computing with data

Data vs Information

Knowledge
technologies

- Exposure to a range of computing technologies for:
 - Making use of uncertain, irregular, or complex data.
 - Accomplishing tasks that may not be well-specified or well-understood.
 - Supporting humans who are engaged in discovery or decision-making.
- A broader understanding of the kinds of things that can – and can't – be accomplished computationally.
- Insight into some research activities in computing, why they are undertaken, and how.

Far more knowledge technology topics are out there than are in!

- Computational modelling: traffic, medical, climate, ...
- General approximation and reasoning techniques for computing solutions in the presence of formal intractability. (But we do look at a couple of specific examples.)
- Natural language processing, machine translation.
- Image analysis, image matching.

... and many others.

Databases

Computing with data

Data vs Information

Knowledge
technologies

Most data generated by humans and computers today is for consumption by **computers**

Facilitated by:

- database schemas
- mark-up languages
- programmatic APIs

Database querying, and basic computational processing of data, asks:

What data satisfies a given pattern?

- retrieval of records
- linking data across multiple data sources
- descriptive statistics
- report generation, summaries
- visualisations

Introduction to
Knowledge
Technology

From Databases
to Knowledge

Databases
Computing with data
Data vs Information
Knowledge
technologies

Computers and algorithms were originally developed to solve what might be called **concrete** tasks. For example (tiny selection):

- Compute a missile trajectory.
- Crack a code (decryption).
- Do accountancy over financial data.
- Operate a camera (focus, exposure), store the image.
- Guide a cutting tool, operate an assembly line.
- Map mouse movements to cursor movements.

In common: the task is well-defined, we can assess whether the solution is correct.

In these tasks, the data is transformed in a mechanical way or leads to a mechanical action, but only in a very limited way do they enhance our (that is, human) knowledge.

Hence – not “knowledge technologies”.

Introduction to
Knowledge
Technology

From Databases
to Knowledge

Databases

Computing with data

Data vs Information

Knowledge
technologies

Consider tasks where the data is irregular or unreliable, or the outcome is not well-defined:

- List of answers to a typical web query.
- Translation between languages.
- Compression of an image.
- Identification of what a health condition might be caused by; identification of a treatment.
- Finding an “optimal” route between two locations. (Optimal? Distance, time, stress, fuel?)
- Deciding what movie to watch.

“What movie to watch?” (Or music to buy, or place to visit, or . . .)

This is not a computational task – but we do use computers to *mediate* between us and data, in helping to reach a decision.

Context is critical: the origin of the data, the consumer of the output.

These use, produce, or enhance human knowledge.

Technology

From Databases
to Knowledge

Databases

Computing with data

Data vs Information

Knowledge
technologies

Knowledge technologies tend to be either fairly general (e.g., machine learning algorithms) or fairly specific (e.g., machine translation).

General: the data must be transformed to suit the axioms or assumptions of the method, in a rigorous way.

Specific: detailed understanding of the task is used to drive development of the method, perhaps by drawing on a toolkit of components and of solutions to similar problems.

- A specialized problem: parse a particular language.
- An approximate problem: assign a document to a category.
- A general problem: find features of the data items that discriminate between categories.

**Knowledge
technologies**

Finding solutions to tasks requires application of computational thinking:

- How should the data be represented?
- How should it be manipulated?
- What heuristics or simplifications can be safely applied?
- Can the problem be transformed or rearranged in a way that usefully changes the costs?
- Does it have properties that let it be addressed by sorting?
- Does it have properties that let it be addressed by searching?
- It is possible to eliminate the need to consider global properties, allowing a focus on local properties? That is, does all of the data have to be considered holistically, or can it be divided in some way?
- How will a solution behave as the data approaches boundary conditions? (Increase or decrease in number of errors; data items unique or frequently repeated; as item size or item number grows, ...)

Databases
Computing with data
Data vs Information
Knowledge
technologies

Consider effectiveness rather than correctness.
(Can a document ranking possibly be “correct”?)

Identify features and characteristics that can be quantified.

Identify approximations to the task.

Consider whether the outcome is likely to seem plausible or appealing.

Whether it makes sense to consider training data from which tailored solutions can be automatically learnt. (Which may make a solution easy, but may make it difficult to gain insight into the problem.)

Ask: What does signal look like? What does noise look like?
What would a human do, given sufficient stamina and memory?
What output would a human produce?

Is a human part of the loop in some way? How is the output to be consumed?

Example: All of these questions apply to aspects of web search.
